

AUDITOR BRIEF · NOT A LEGAL OPINION

Neem Studio

An AI-native operating system for one children’s series. The studio owns the canon, the workflow, and the record. Models are replaceable tools.

Gulmohar Gali · Hindi · ages 3–5 · India

16 October 2026

Steps 01–11

1 · HOW TO READ THIS

What this document is

This is a product and control brief for someone checking whether Neem Studio does what it claims. It is not a legal opinion, a financial audit, a penetration test, or a clearance to publish.

Claims below are limited to the working studio as built through step 11. Where a thing is only prepared, or only proven once, it is marked that way. Unknown is written as unknown.

> Publishing is off. The episode “Count the Thunder” stays unpublished, with a commercial-rights red flag and no audience numbers. A live text model cannot clear that flag.

2 · THE PRODUCT

A studio, not a model wrapper

Neem Studio is the control plane for Gulmohar Gali, a Hindi-first series for children aged 3 to 5, made for an Indian audience and aimed, later, at YouTube. The product is the record of decisions: what is canon, which story version was approved, who approved it, whether rights are cleared, and whether a release is allowed.

The operating rule is fixed. Agents propose. The system validates. A human approves. Nothing in the model’s reply is an approval.

The studio owns

- The intellectual property and the canon
- Stories, scripts, and episode state
- Rights standing and human approvals
- Provenance and the audit log
- The decision to publish, which is currently refused

A model may only supply

- A development draft
- Text, and only through the gateway
- Usage numbers if the provider actually sends them
- Nothing about rights, age, or identity

3 · THE LOCKED WORLD

Gulmohar Gali

The world is one lane under a gulmohar tree: a ground-floor home, a courtyard, a sabzi stall, a footbridge. Production is Hindi first. The age band in use is 3–5. Other ages and other countries are not production targets.

Hard fields include name, age, species, appearance, hair, eyes, and story function. A proposed change stays proposed until a human accepts it. Old episodes keep the canon snapshot they were made with. The fictional Alpine range is a proposal. Mentioning it in a script does not approve it as a location.

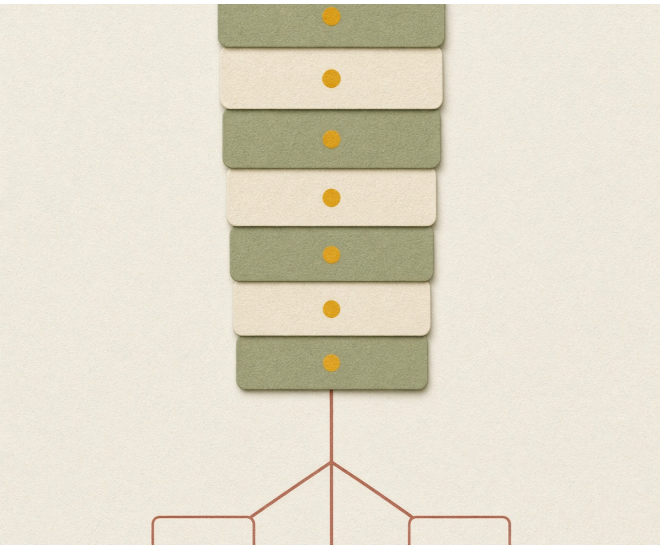

Illustration of the idea only. The system diagram is on the next page.

Who	What is locked	What a model may not do
Meethi	Age 5. Short black hair. Dark brown eyes. Red ribbon. Mustard kurta.	Change her age, hair, eyes, or turn her into a princess with a wand.
Golu	A palm squirrel. Three of his own stripes. A small green cloth. Not a human in a costume.	Give him a shirt, a cape, or human hands.
Dadi Kamla	Meethi's grandmother, 68. Grey hair in a low bun. White sari, marigold border, steel bangles.	Make her the joke, or change the relationship.

4 · ARCHITECTURE

Hybrid, on purpose

Option B. Managed services for ordinary infrastructure. The studio's own data, workflow, provenance, and orchestration stay portable. A provider outage, or a different text model, must not force a redesign of the series.

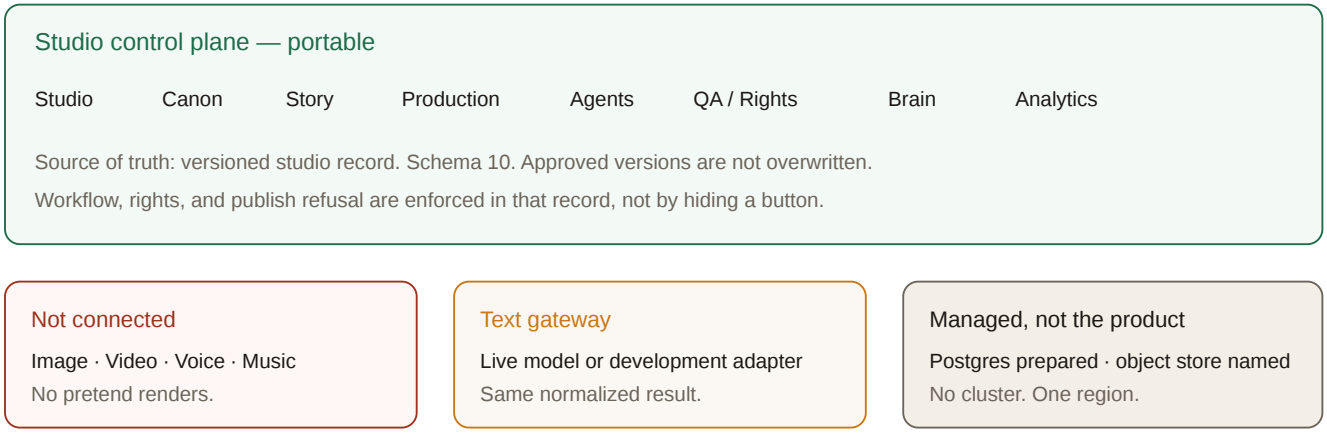

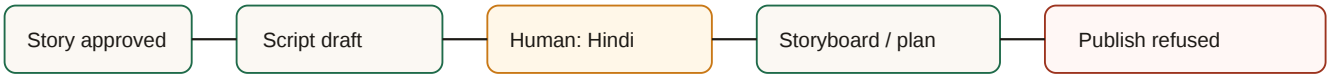

Figure 1. The series sits above the model. Only text is connected. Picture, voice, and music are named and left dark.

Layer	Status	What an auditor can rely on
Application foundation	Partial	Shell, audit, roles, and flags exist. Shared sign-in is not turned on. Postgres is the intended hosted store. The copy a reviewer edits on this device is still the working record.
Versioned source of truth	Implemented	Stable identities, versions, rights, approvals, audit. Schema 10.
Canon and story intelligence	Implemented	Hard and soft canon. Originality bar 75. Similarity block 55. An agent cannot lower the bar or approve a story.
Episode workflow	Implemented	Stages run through "ready to publish." Published is unreachable.
Agents	Partial	Story, script, Hindi, culture, storyboard, plan, QA, rights, and policy propose or review. Voice, music, analytics, and executive agents are not wired. The creative director is inactive.
AI gateway	Partial	One live text model, behind the gateway. Development and standby adapters remain so the provider can be swapped. Image, video, voice, and music are not connected.
Assets and rights	Partial	Metadata, checksums, and new versions. Unknown rights are not treated as cleared. A file bucket is not connected, so picture bytes are not stored as production media.
QA, approval, brain, analytics	Implemented	Checks are independent. Approval names exact versions. The brain only advises. Analytics does not invent numbers for unpublished work.

5 · THE PATH OF AN EPISODE

Human gates stay in the machine

A live model may enter only at "script draft." It cannot jump to "script approved," and it cannot reach "published."

Figure 2. The state machine, simplified. QA, rights, and policy still sit before any human release decision. That decision cannot complete.

Originality and similarity are separate scores. A story that looks too much like another is blocked even if it scores well on originality. A QA result is pinned to the version it checked. A newer version makes that result outdated. It is not reused in secret.

Storyboards and production plans are drafted from an approved script. They are plans. No picture, voice, or music is rendered. An asset request is not a finished asset, and an asset without provenance is a red flag.

6 · THE LIVE TEXT STEP

One model, kept replaceable

Step 11 connected one production text model. The scriptwriter does not call it directly. The path is agent, then gateway, then the text capability, then the adapter, then the model.

	Recorded fact
Provider	xAI, as an adapter named inside the gateway. Domain records say which adapter ran. They do not grow vendor fields on the story.
Model	grok-4.5. Model version: unknown. Not filled in.
Template	SCRIPTWRITER_HINDI, version 1. Ages 3–5. Hindi. A later edit is a new version. Version 1 is not rewritten.
Context sent	The approved story version, the canon snapshot, the locked cast, approved locations, and the age band. Not the whole studio, not the audit log, not credentials.
Output	A development draft. Language review stays pending. Canonical version stays empty until a human later approves, which this draft does not do by itself.
Validation	A successful call is not a successful script. Cast, age, Hindi script, locations, and a few locked attributes are checked. A failure is stored. The text is not silently rewritten, and it is not automatically regenerated.
Retry	A timeout may be retried once. A content failure may not spawn another variation.
Cost	Unknown, unless the provider returns a number. Token counts are stored only when sent. They are not estimated.
Proof	One live Hindi draft was generated for an approved Gulmohar Gali story, checked, stored, and left unapproved. Count the Thunder was not altered. The same filing path accepts the development adapter, which is the swap test.

> The credential never reaches the page, the studio record, or the audit log. The browser bundle used to ship the app does not contain the provider address or the secret. The live call runs only when a person presses the draft button. It does not run when the page opens.

What the model still cannot do

- Approve a script, a story, or a location
- Change canon, or treat a mention of the Alpine range as approval
- Clear rights, pass QA, or publish
- Draft Count the Thunder
- See or spend anything except the one text task it was given

7 · RIGHTS AND THE FIXTURE

Unknown is not cleared

Rights standing is its own record. Unknown does not mean cleared. A missing commercial-rights note is a red flag. An agent, including the rights agent, cannot clear that flag. A human clearance is a separate act, and even then the publish function still refuses.

Fixture	Standing	What must remain true
Count the Thunder	Release blocked	Unpublished. Commercial-rights red flag. No invented audience data. No publication record. Connecting the text model did not clear it.
Alpine range	Proposed	Not an approved production location. A script that names it does not add it to canon. A human could approve it later. The model cannot.
New live draft	Development draft	Rights unknown. Not approved. Not cleared for commercial use by the act of generation.
YouTube	Not callable	No upload, no channel creation, no automatic publish. Policy review does not override rights.

Analytics, where it exists, speaks in evidence. An unpublished episode is unknown, not zero. A correlation is not written as a cause. There is no warehouse and no collection of children’s behavioural data. The analytics agent itself is not implemented.

8 · PROVENANCE

A draft can be walked backwards

Figure 3. Each live draft is tied to the execution, the exact template version, the approved story version, and the canon snapshot. Changing the script adds a version. It does not erase the previous one.

The audit log is append-only for these acts: generation, validation failure, retry, and approval attempts. An agent who tries to approve their own output is refused, and the refusal is recorded. Approval, when it happens, names the person, the time, and the versions. It is not inferred from a passing check.

9 · WHAT IS DELIBERATELY ABSENT

Not built, and not implied

Do not assume these exist

- Image, video, voice, or music generation
- A rendering farm or a finished episode
- YouTube publishing or a channel
- Autonomous production or autonomous release
- Fine-tuning, retrieval, or a vector database
- Multi-model routing or a billing system
- A data warehouse or child profiles
- Merchandise, games, or other territories

Prepared, not operating as production

- Postgres as the hosted document store
- Object storage for media bytes
- Shared accounts and sign-in
- A second text adapter, used to prove a swap
- Commercial-use terms for the live model
- A model version string
- A rupee or dollar cost

The Hindi editor, cultural reviewer, and policy agent give opinions inside the studio. They are not second and third live models. The storyboard and animation agents write plans. They do not draw.

10 · CHECKS WORTH REPEATING

If you only test twelve things

	Check	Expected
1	Publish any episode, including a “ready” one	Refused
2	Call the YouTube path	Not callable
3	Open Count the Thunder	Blocked, flagged, no audience row
4	Ask the model to draft that episode	Refused
5	Let an agent approve a script	Refused and audited
6	Treat unknown rights as cleared	Rejected
7	Reuse QA after the story version changes	Outdated
8	Put the Alpine range into a shot list	Rejected until a human approves the location
9	Generate a Hindi draft	Development draft, unapproved, linked to story, canon, template, execution
10	Break canon in the model text	Kept, flagged, not rewritten, not auto-retried
11	Change the prompt	New template version. The old body stays
12	Look for the provider secret in the page	Absent

11 · RECOMMENDATIONS

What to do next, in order

Do not add picture, sound, or publishing in the next step. The control plane is ahead of the media. Catching up by generating video would throw away the point of the architecture.

Order	Step	Why it is next	Still refused
1	Counsel reads the live model’s terms before any draft is treated as usable in a commercial episode.	Generation is not a licence. Commercial use is unknown.	Do not mark rights cleared from a successful call.
2	A person reviews one real Hindi draft in the existing Hindi and approval gates.	Proves the human path on live text, not only on template text.	The model still cannot approve. Publish stays off.
3	Keep Count the Thunder and the Alpine proposal as regression fixtures on every later step.	They are the proof that new tools do not weaken old locks.	Do not “clean up” the red flag.
4	Connect real file storage before any image bytes exist.	Metadata without a bucket is honest. Bytes inside the studio record would not be.	No image model yet.
5	Turn on shared sign-in only when a second person must edit.	Accounts are cost and complexity until then. One reviewer does not need them.	Do not invent a demo user in production.
6	Add a second text provider only as another swap test.	Replaceability is the requirement. Routing and “best model” are not.	No optimisation layer.
7	Leave voice, music, and picture until a script has survived human review and the rights note is written by a person.	Those adapters are more expensive and harder to unwind.	No render farm, no YouTube.

Suggested step 12, in one line

Take one live Hindi development draft through the Hindi review and the human approval gate, record the versions, and stop. Do not publish. Do not draw.

12 · RESIDUAL RISK

What this brief does not close

- The commercial terms of the live model have not been cleared. A good draft can still be unusable.
- Cost is unknown. Absence of a price is not a price of zero.
- The hosted database is the intended source of truth. The working copy on the reviewer’s device is still what the screens edit. Treat a backup of that record as the portable copy until hosting is the daily path.
- This was not a security test of the provider, the host, or the browser. The secret-handling claim is limited to: the key is read on the server, and it was not found in the client bundle or the studio record.
- One live generation was proven. That is not a load test, a quality score, or a promise about the next draft.
- Child-safety review is a gate inside the studio. It is not a certification, and it does not replace a human.
